Images classification

Mise en œuvre de Neural Network

- **NN: Multi – Layer**
  - Présentation du problème **non linéairement séparable**
  - Implémentation du Problème **non linéairement séparable (**avec tensorflow, keras **)**
    - Exemple 1: simple XOR problem
      - Générer les données
      - Créer et entrainer un multilayer neuralnetwork
    - Exemple 2: general XOR problem
      - Générer les données
      - Créer et entrainer un multilayer neuralnetwork
    - Exemple 3: fashion classification problem
    - Exemple 4: hand written digits classification problem
  - Implémentation from scratch
    - Exemple: fashion classification problem

Problem

Séparation de
AND, OR,NAND, NOR, XOR

And

	F	T
T	F	T
F	F	F

On peut avoir une séparation linéaire

OR

	F	T
T	T	T
F	F	T

On peut avoir une séparation linéaire

XOR

	F	T
T	T	F
F	F	T

On ne peut pas avoir une séparation linéaire

Séparation de X0R

XOR

	F	T
T	T	F
F	F	T

On peut utiliser plus qu'une ligne pour faire la séparation

XOR = (!AND) and (OR)

Utiliser keras pour créer un réseau de neurone avec plusieurs neurones (couche, layer)

Ce qu’il faut connaitre:

1. **Comment créer un multilayer neural network (en général)?**
2. Découvrir les éléments du neural network créé: coeficients, bias

Neural Network Model et ses paramètres

1. Architecture
2. Créer le modèle
3. Créer une couche et l’ajouter au modèle
4. Paramètres d’une couche

HIDDEN LAYER
OUTPUT LAYER
INP
LAY

Model et ses paramètres

```
from keras.models import Sequential
from keras.layers import Flatten, Dense, Activation
```

```
model = Sequential()
```

```
#input_layer=Flatten(input_shape=[2, 1])
#model.add(input_layer)
hidden_layer=Dense(4,
input_dim=2,kernel_initializer='ones',bias_initializer='zeros
')
model.add(hidden_layer)
output_layer=Dense(3,
kernel_initializer='random_uniform',bias_initializer='ones')
model.add(output_layer)
print(model.summary())
```

```
model.compile(loss="categorial_crossentropy",
            optimizer="adam",
            metrics=["accuracy"])
```

```
[array([[1., 1., 1., 1.],[1., 1., 1., 1.]],
dtype=float32),
       array([0., 0., 0., 0.], dtype=float32),
 array([[-0.03575971, -0.02119735,
0.01558626],
     [ 0.04222678, -0.04578313,  0.0360521 ],
     [-0.02753322,  0.00745941,
-0.04211374],
     [-0.04299896, -0.04190966,
0.02975568]], dtype=float32),
     array([1., 1., 1.], dtype=float32)]
```

Revenons à XOR Problem

Les étapes à suivre pour créer le modèle

1. **Data**
2. **Model**
   - Create the model, compile the model: keras, tensorflow
     - Optimizer function: adam
     - Loss function: binary_crossentropy
   - Train the model
   - Parameters
3. **Prediction**
4. **Evaluation**

1. Dataset

```
X=np.array([[0,0],[0,1],[1,0],[1,1]])
y = np.array(np.logical_xor(X[:, 0] > 0, X[:, 1] >
0), dtype=int)
```

2. Model

```
from keras.models import Sequential

from keras.layers import Activation, Dense,Flatten

model = Sequential()

#input_layer = Flatten(input_shape=[2,1])

hidden_layer = Dense(2,input_dim=2,
kernel_initializer='ones',bias_initializer='zeros', activation='relu')

output_layer =
Dense(1,kernel_initializer='random_uniform',bias_initializer='zero
s', activation='sigmoid')

#model.add(input_layer)

model.add(hidden_layer)

model.add(output_layer)

coef=model.get_weights()

print(coef)
```

```
model.compile(loss='binary_crossentropy',optimizer='adam',metri
cs=['accuracy'])
```

```
model.fit(X,y,epochs=1000)

print(model.get_weights())

print(model.predict(X)
```

[array([[1., 1.], [1., 1.]], dtype=float32), array([0., 0.], dtype=float32), array([[-0.03330588], [0.04190588]], dtype=float32), array([0.], dtype=float32)]

bias
1
w11
w21
bias
3
w31
w12
bias
2
w32
w2
2

```
model.fit(X,y,epochs=1000)
print(model.get_weights())
print(model.predict(X)
```

2. Model (avec une autre fonction d'activation)

```
from keras.layers import LeakyReLU
act = LeakyReLU(alpha = 0.3)
```

```
model = Sequential()
hidden_layer = Dense(2,input_dim=2, kernel_initializer='ones',bias_initializer='zeros',activation=act)
model.add(hidden_layer)
output_layer = Dense(1,kernel_initializer='random_uniform',bias_initializer='zeros',activation='sigmoid')
model.add(output_layer)
model.add(hidden_layer)
model.add(output_layer)
coef=model.get_weights()
print(coef)
```

```
model.compile(loss='binary_crossentropy',optimizer='adam',metri
cs=['accuracy'])
```

```
model.fit(X,y,epochs=1000,batch_size
=4)

print(model.get_weights())

print(model.predict(X))
```
